Pallas

HPC Trace Analysis at scale

Catherine Guelque Francois Trahay Valentin Honoré

Télécom SudParis - Benagil INRIA research team

Introduction & Context

My PhD

Working at Francois Trahay and Valentin Honoré
And also people from INRIA Bordeaux !

PEPR NumPEX (that's us !)

- Creating the software stack for **exascale** computers
- Alice Recoque (2025): **Heterogenous architectures**
 - 10k+ CPU Nodes
 - 10k+ GPUs
- Various paradigms: **MPI, CUDA, StarPU**

Scalability issues

- Load-balancing
- Concurrent access to resources
- Interactions between threads
- Non-negligeable communication times

To scale/debug/optimize these apps, **we need performance analysis tools !**

Traces & tracing tools

Traces

- Timeline of an execution
- Stores events with data
 - Timestamps
 - Arguments
 - Callstack
 - ...

Tracing tools

Intercept known function calls (MPI, OMP, CUDA) and log them to create a trace

Figure 1: An OTF2 Trace visualised with Vampir.

Issue: traces quickly become huge (hard to store and analyse)

Types of traces

Sequential

Array of events in chronological order

- Straightforward to read & write
- Redundancy → heavy traces

Structural

HPC apps are predictable → include the structure of the program

- Better compression
- More information
- Easier analysis

What do we need ?

We need a new, more **scalable** trace format, with:

- low overhead (unobtrusive)
- structure detection
- scalable analysis
- efficient compression

i.e an **analysis-focused highly compressible trace format**

Pallas

Trace format

- **Structural, generic** trace format
- Automatic sequence detection
- Provides reading/writing API via C/C++ library
- Provides an OTF2 writing API (compatible with many tools)

EZTrace

- Intercepts MPI/OMP/CUDA calls
- Builds OTF2 traces via OTF2 library
- With our API, creates Pallas traces

Example: EZTrace

EZTrace

Intercepted MPI function:

- **Enter** and **Leave** events = scope
- **Punctual** event = message sent

```
int main() {  
    DO_FOR(200) {  
        MPI_Send(...);  
        MPI_Recv(...);  
    }  
}
```

Structure detection

OTF2 to Pallas

- **Events** are stored as **generic tokens**
- Enter/Leave events are converted to **Sequences** (makes shorter arrays)
- **Sequences** and **Loops** are also generic tokens.

Structure detection

Add a token → Loop detection algorithm

Repetition is detected:

- Check already existing **Sequences** with hashing function
- Replace repeating Tokens with new **Loops** token

Structure detection

OTF2 to Pallas

- **Events** are stored as **generic tokens**
- Enter/Leave events are converted to **Sequences** (makes shorter arrays)
- **Sequences** and **Loops** are also generic tokens.

Structure detection

Add a token → Loop detection algorithm

Repetition is detected:

- Check already existing **Sequences** with hashing function
- Replace repeating Tokens with new **Loops** token

Structure detection

OTF2 to Pallas

- **Events** are stored as **generic tokens**
- Enter/Leave events are converted to **Sequences** (makes shorter arrays)
- **Sequences** and **Loops** are also generic tokens.

Structure detection

Add a token → Loop detection algorithm
Repetition is detected:

Structure detection

Add a token → Loop detection algorithm

Repetition is detected:

- Check already existing **Sequences** with hashing function
- Replace repeating Tokens with new **Loops** token

Trace format

Parallel Write/Read

- One folder per process
- No concurrent writing
- Easy parallel reading

Smart data storage & retrieval

- Structure, statistics & metadata are independent of data
 - On-demand accessibility
- Durations are grouped by tokens
 - Decent compression

Benchmarks and Evaluations

Experimental parameters

- NAS Parallel Benchmarks, AMG, MiniFE, Lulesh & Quicksilver
- Every experiment was run on **Jean-Zay**
- Tested with
 - OTF2 using EZTrace
 - Pallas using EZTrace and OTF2 API
 - Pilgrim (trace format & event interception)
- Almost all experiences on 4096 MPI processes.

Key points

- **Lower is better !**
- $OTF2 < Pallas < Pilgrim$
- Low overhead for Pallas
- Pilgrim struggles with event variety

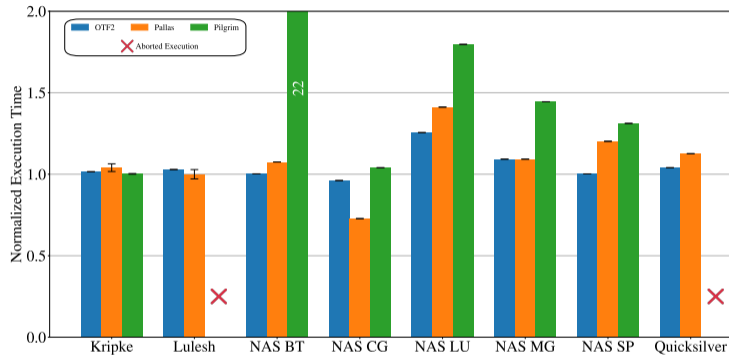

Figure 2: Execution time of the different tracing scenario, normalized by the vanilla run of the application, for the different applications over 4096 MPI processes.

Trace size & compression

Key points

- **Lower is better* !**
- Pilgrim < Pallas < OTF2
- OTF2 $\approx 10 \cdot$ Pilgrim
- Pilgrim collects less information than EZTrace
- Pilgrim **compresses all the timestamps together.**

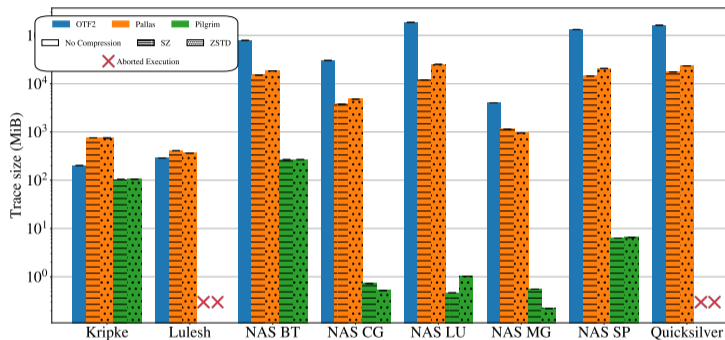

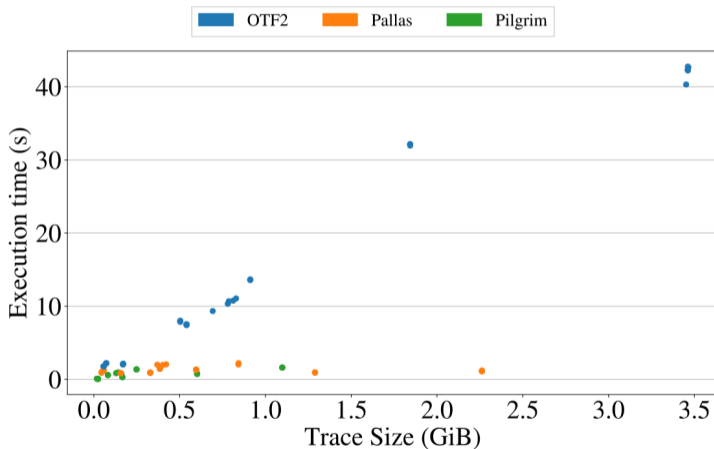

Figure 3: Comparison of trace size for different trace formats, when tracing the different applications over 4096 MPI processes.

Analysis speed: Communication Matrix

Time to plot a communication matrix vs trace size.

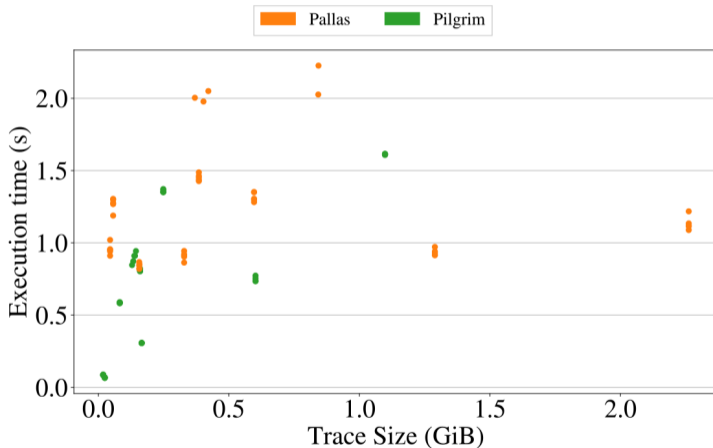

Key points

- Pilgrim/Pallas \lll OTF2
- Pilgrim/Pallas \rightarrow scalable
- Not pictured: Kripke
OTF2 analysis was 450s

Analysis speed: Communication Matrix

Time to plot a communication matrix vs trace size.

Key points

- **Pallas \approx Pilgrim**
- Analysis speed uncorrelated with actual trace size.
- Pallas reads only the header.

Conclusion

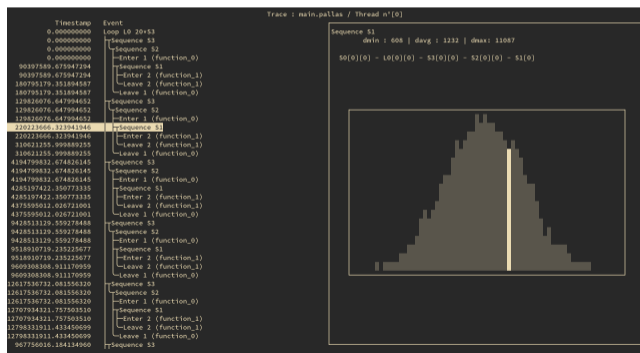

Conclusion

Pallas:

- ✓ Low Overhead
 - ✎ That scales well
- ✓ Structure detection
- ✓ Efficient timestamp storage with compression / encoding
- ✗ Efficient compression
- ✓ Basic scalable & performant analysis
- ✓ On demand-trace loading and exploration

Future developments

- Evaluating Pallas tracing on non-MPI kernels
- Evaluating Pallas at larger scales (currently testing 4k threads)
- Inter-trace compression → "Vertical" scalability
- Testing more efficient compression techniques
- More complex and scalable analysis
- Automatic event filtering

Appendix

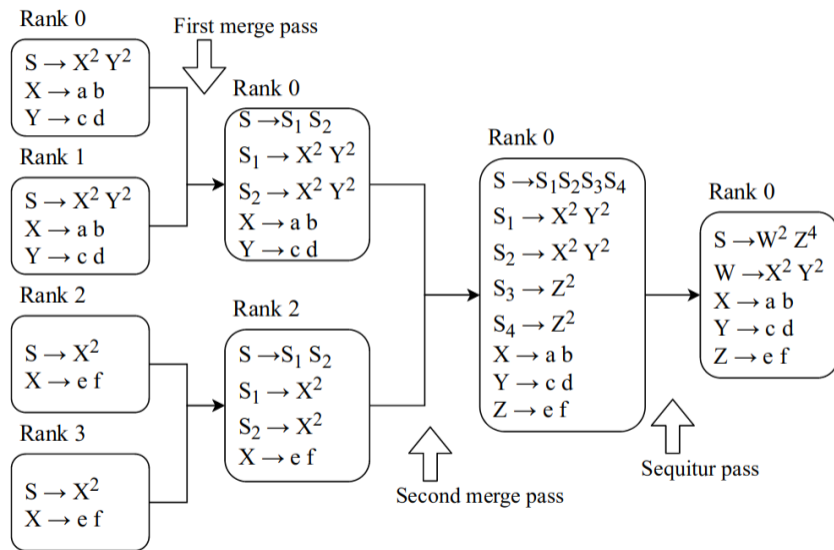

Timestamp compression & encoding

Durations are similar → easily compressible

Different storage options:

- No timestamps (Structure only)
 - Encoding:
 - Removed leading 0s
 - Replace leading 0s (as presented before)
 - Compression:
 - ZSTD
 - SZ
 - ZFP
 - Bin-based (similar to QSDG)
 - Histogram-based (same thing but Gaussian distribution)
- } Lossy compression

(Pilgrim) Inter-trace compression

Using NCURSES

```
Trace : main.pallas / Thread n°[0]
```
